## **Research on the Characteristics and Effects of Climate Extremes on Multi-spatial-temporal Scales in the Mongolian Plateau** Chunlan Li, 2024-03-27

Compared with average climate changes climate extremes which are considered as low probability events have greater impacts on natural and social systems due to their suddenness unpredictability and strong destructiveness Located in the typical arid semiarid climate transition zone the Mongolian Plateau dominated by herbage animal husbandry is greatly affected by climate extremes and its ecosystem is extremely fragile In the context of global warming the spatial temporal variation research about climate extremes and their impacts on vegetation is not only beneficial to the protection of the grassland ecological environment in the Mongolian Plateau but also of great significance to formulate an effective meteorological disaster risk management Based on daily highest temperature daily minimum temperature and daily precipitation dataset of 111 meteorological stations over Mongolian Plateau from 1961 to 2014 Firstly sixteen extreme temperature indices and eleven extreme precipitation indices were calculated Then multi spatial temporal characteristics of climate extremes in the scope of intensity duration and frequency were analyzed At the same time the vegetation variations were analyzed based on GIMMS NDVI3g data Thirdly correlation analysis and multiple stepwise regression analysis were used to analyze the relationships between extreme climate indices and NDVI in different spatial scales from the perspective of single factor and multiple factors respectively Finally the future change of climate extremes in duration were explored based on the climate model data At the same time the vulnerable areas of grassland and forest were also identified and adaptive options of different scales were proposed Researchers engaged in extreme climate change and managers of government departments are the readership primary audience for the work

Working group 1,2014 The report also provides a comprehensive assessment of past and future sea level change in a dedicated chapter Analysis of Climate Variability Hans v. Storch, Antonio Navarra,2014-01-15 Special Issue on Regional Climate Variability and Change L.M. Leslie,2005 Long and Short Term Variability of Climate Heinz Wanner,Ulrich Siegenthaler,1988

**Regional Climate Variability and its Impacts in the Mediterranean Area** A. Mellouki,A.R. Ravishankara,2007-09-23 Global change due to natural processes and anthropogenic activity as well as the natural variability of the climate system will impact all areas of the globe However the impact will not be uniform and different impacts of differing magnitude and nature will be felt in various regions of the globe The Mediterranean region like other regions of the world will face some unique and different impacts The uniqueness and difference in the Mediterranean are to be expected given some special dynamical chemical biological and land characteristics of the region The Mediterranean region is often exposed to multiple stresses such as a simultaneous water shortage and air pollution This is a consequence of its unique location and emissions One of the common stresses in North Africa is water shortage and distribution amongst the seasons Air pollution can often add to the water stress Air pollution occurs due to emissions in the region as well as from those transported from other areas and can occur when there is low water availability Multiple stresses are likely to grow in the future when human induced stress is likely to increase due to the rapid industrialization of the region This NATO workshop was set up to discuss these issues in general and the influence of chemical emissions and

transformation in particular This workshop was special because it involved a very large number of scientists 75% from the region either from North Africa or the Mediterranean Europe Many key issues some of which are specific to this region were identified Details of the finding and suggestions are presented in the articles in this volume The workshop was held in Marrakech Morocco from 23rd to 26th November 2006

### **Temporal Climatology and Anomalous Weather Analysis**

Weihong Qian,2017-02-20 By breaking down atmospheric variables into temporal climatologies and anomalies this book demonstrates that all weather extremes and climatic events are directly associated with the anomaly component of atmospheric motion We can use the anomaly based synoptic chart and dynamical parameters to objectively describe these extremes and events The conception and differences of weather climate and general circulation tend to confuse us because there are no clear physical definitions available for them Weather extremes such as heat waves cold surges freezing rains heavy rains severe drought unusual storm tracks and tornados are common on our planet s surface Climatic events such as Arctic warming and declining sea ice have become hot topics in recent years An approach based on breaking down total variables into temporal climatologies and anomalies can be used to identify general circulation analyze climatic anomalies and forecast weather extremes Accordingly this book will appeal to students teachers and forecasters in the field of weather and climate alike

*Long and Short Term Variability of Climate* Heinz Wanner,Ulrich Siegenthaler,2014-03-12 The book deals with natural climate variations during the last 600 000 years Among the topics astronomical influence on paleoclimates climate and environment natural CO<sub>2</sub> variants based on investigations of ice curves and climatic information from wood density are the most important This long and short term variability is the base for modelling and prediction of anthropogenically induced climatic changes
